

Rust Meetup Munich

February 2018

@claus__m

Schedule

6:30pm ~ 7pm: Me talking

7pm ~ 9pm: Eat, drink, build

Rust on VSTS

Claus Matzinger (@claus_m)

Building with Cargo

`cargo build`

`cargo test`

`cargo bench`

`cargo run`

`cargo clippy`

`cargo fmt`

`rustfix` 😊

Why am I here?

You like being

Lazy

Consistent

Right

Quick

Curious

(like me?)

Continuous Integration / Delivery

Consistent collaboration

1-button build, release & deploy

Traceability

Faster

Centralized code status

Secrets management

Production, staging, testing can all be the same

Using Continuous Integration / Delivery

Building Rust

Rebuilding Rust

Cross Compilation

Auto deployment :)

Building Rust

Epochs

Nightlies

Tooling (rustfmt, rustfix, clippy, ...)

Documentation

Binary downloads (e.g. for containers)

Rebuilding Rust

Dependency updates!

- Deprecations

- Staleness

- Immature crates

Epoch safety

Check how out of date your crate is 🧐

<https://deps.rs>

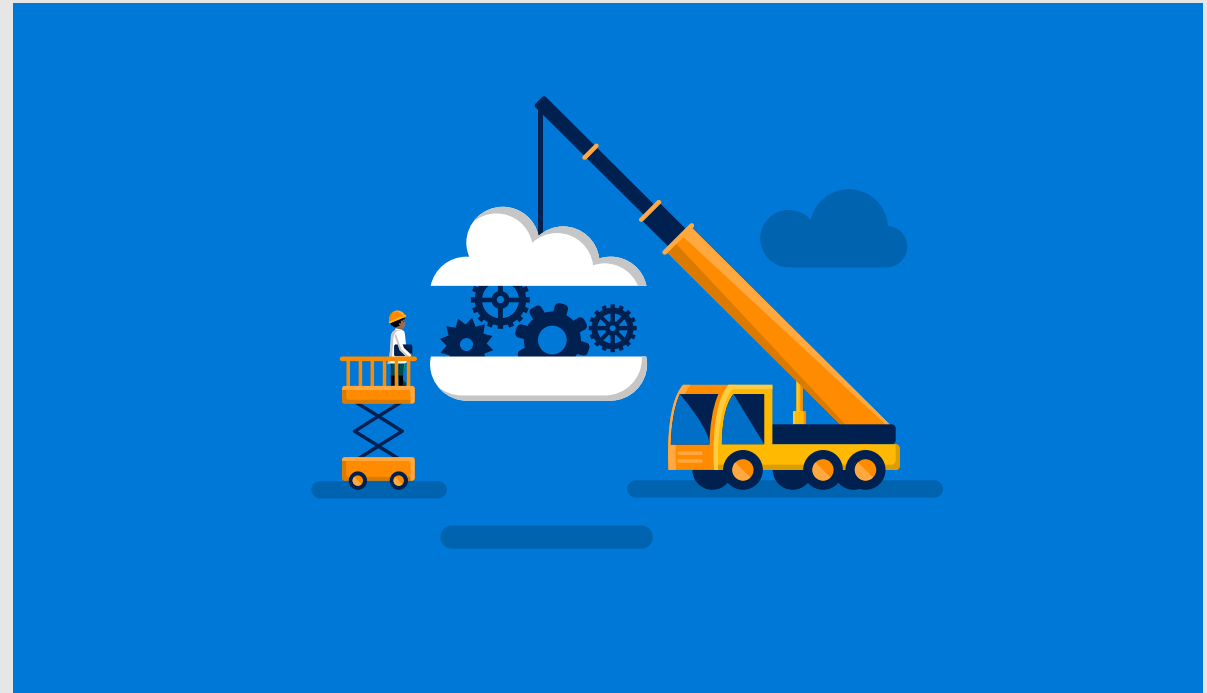

Cross Compilation

Install & maintain:

Toolchains (e.g. musl for Alpine containers)

Dependencies

Platforms

Auto Deployment

Deployment environments

Run all tests

Roll back bad deployments

Blue/Green strategy

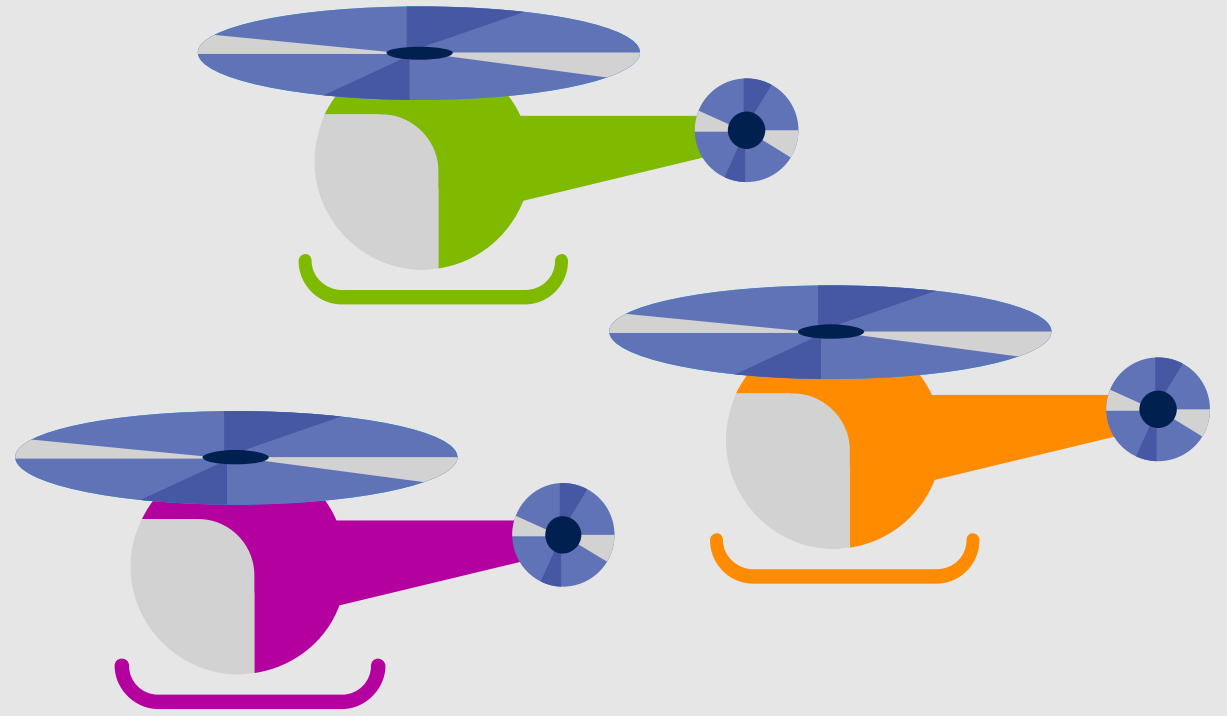

Use orchestrators

Prior Work

Travis

CircleCI

Jenkins

Amazing GitHub template to get started:

<https://github.com/japaric/trust>

Another way: Visual Studio Team Services

Deploy to Azure cloud

Private pipeline

RBAC access control

Any Git/SVN repository

(also, it's free for 240min/month)

Visual Studio Team Services

Project management (Kanban, Scrum)

Source code management

Access control

Load testing

Build & release

Issue management, queries, links, etc.

Visual Studio Team Services Vocabulary

Task: Atomic unit of doing stuff

Phase: Sequence of tasks

Queue: Phases to be run on agents

Agent: A host running a service

Building Rust Projects

Powershell/Bash: Install rustup, install toolchain, build

Docker container:

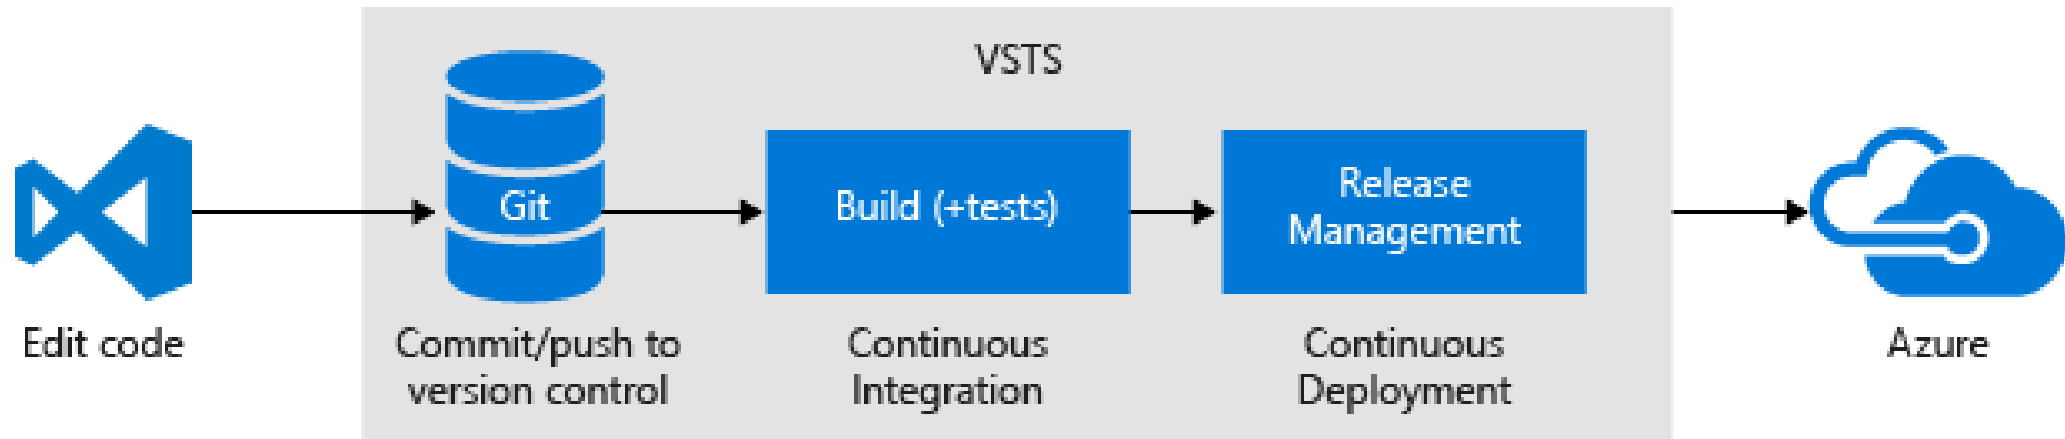

rust:1.23.0

dlecan/rust-crosscompiler-arm

custom, based on those

Steven's work: <https://stevenmurawski.com/2017/10/how-to-build-rust-with-vsts/index.html>

Demo: A Simple Rust Web App

Why Do Any Of That?

Quicker ARM builds (my reason for doing this 😊)

Automated container deployments

Learn more about DevOps

Reproducible builds

Link builds, work items, deployment infrastructure, etc.

Wrap Up

- Use CI/CD for your projects
- Build in/with containers
- Rust & containers can be tricky
- VSTS is a surprisingly good alternative to Travis et al (for me)
- Building Rust should also be boring (sorry)

Twitter @claus__m

Thank you!

@claus__m

Set up a VSTS pipeline

Use your (or any) Open Source Rust project

e.g. <https://github.com/celaus/rust-hello-web>

Create a build pipeline

- Run cargo test

- Run cargo build --release

- “Publish” results as a release

Run rustfmt, rustfix, clippy as tests

Create multi-architecture builds

Windows, Linux, ARM (Linux)

Build and deploy a container application from a release
